 The issue is to inject actions between processes of a workflow.

Providing injection of actions in a workflow after ending a process and before the beginning of the next one.

- **1** Introduction
- 2 Cadence

Definition

Cadence is an Eclipse component which allows injecting actions between two sub-processes of a workflow.

Vocabulary

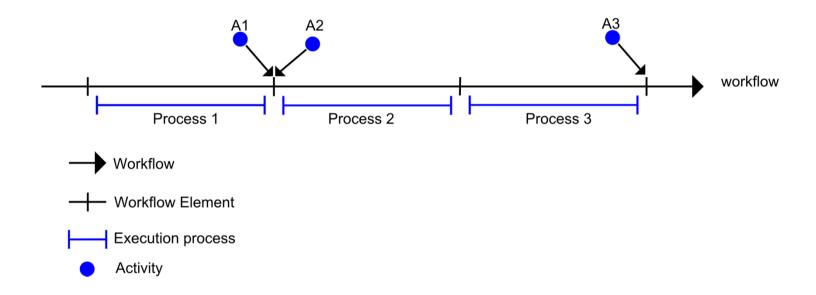

Workflow: a process where sub-processes are sequentially executed. **Workflow element**: a workflow step between two sub-processes. **Activity**: a contribution to a workflow element; it is executed as an independent program.

THALES

- **1** Introduction
- 2 Cadence

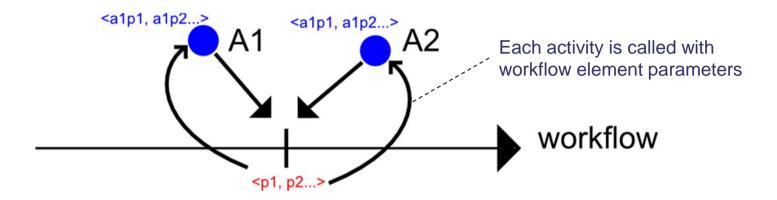

Generic representation of a Cadence workflow

Sub-processes are represented with blue segments (process 1, process 2...) in the figure and are sequentially executed.

Workflow element and activity parameters

A Workflow element declares parameters (red ones in capture above). Activities that contribute to this workflow element receive these parameters.

Activities also declares its own parameters (blue ones in the figure).

- **1** Introduction
- 2 Cadence

Cadence provides two extension points:

Definition of workflow and its workflow elements:

• com.thalesgroup.mde.cadence.core.workflow.declaration [EP1]

Definition of activities:

com.thalesgroup.mde.cadence.core.activity.declaration [EP2]

Activities must implement the contract defined by the IActivity interface (See the example below).

Cinematic to use Cadence

- 1. Declare a workflow with the extension point [EP1]
- 2. Declare workflow elements in a previous workflow
- 3. For each workflow element, declare its required parameters
- 4. Declare activities and its workflow element with the extension point [EP2]
- 5. For each activity, declare the required parameters
- 6. Define a Java class for each activity

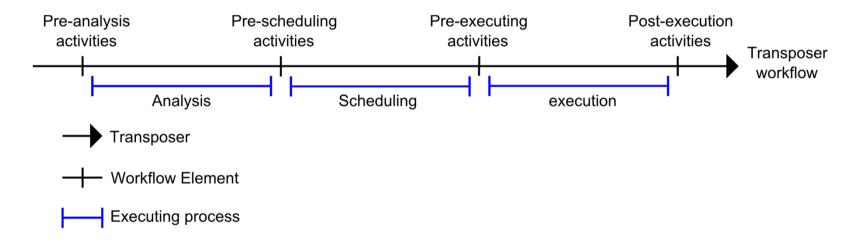

- **1** Introduction
- 2 Cadence

Cadence does not provide a standalone execution. It is involved by components such as Composer and Transposer during execution of workflow activities.

Example: Transposer defines one workflow and four workflow elements.

Kitalpha is supported by **Sys2Soft** and **Crystal**, respectively French and European projects

Thexnk You!
